Points out of 1

Consider the integer

$$
N=9+99+999+9999+\cdots+\underbrace{99 \ldots 99}_{321 \text { digits }} .
$$

Find the sum of the digits of $N$.

## Answer:

Jenn randomly chooses a number $J$ from $1,2,3, \ldots, 19,20$. Bela then randomly chooses a number $B$ from $1,2,3, \ldots, 19,20$ distinct from $J$. The value of $B-J$ is at least 2 with a probability that can be expressed in the form $\frac{m}{n}$, where $m$ and $n$ are relatively prime positive integers. Find $m+n$.

## Answer:

In $\triangle P Q R, P R=15, Q R=20$, and $P Q=25$. Points $A$ and $B$ lie on $\overline{P Q}$, points $C$ and $D$ lie on $\overline{Q R}$, and points $E$ and $F$ lie on $\overline{P R}$, with $P A=Q B=Q C=R D=R E=P F=5$. Find the area of hexagon $A B C D E F$.

## Answer:

A soccer team has 22 available players. A fixed set of 11 players starts the game, while the other 11 are available as substitutes. During the game, the coach may make as many as 3 substitutions, where any one of the 11 players in the game is replaced by one of the substitutes. No player removed from the game may reenter the game, although a substitute entering the game may be replaced later. No two substitutions can happen at the same time. The players involved and the order of the substitutions matter. Let $n$ be the number of ways the coach can make substitutions during the game (including the possibility of making no substitutions). Find the remainder when $n$ is divided by 1000 .

## Answer:

$\square$

## Question 5

Points out of 1

A moving particle starts at the point $(4,4)$ and moves until it hits one of the coordinate axes for the first time. When the particle is at the point $(a, b)$, it moves at random to one of the points $(a-1, b),(a, b-1)$, or $(a-1, b-1)$, each with probability $\frac{1}{3}$, independently of its previous moves. The probability that it will hit the coordinate axes at $(0,0)$ is $\frac{m}{3^{n}}$, where $m$ and $n$ are positive integers, and $m$ is not divisible by 3 . Find $m+n$.

## Answer:

$\square$

In convex quadrilateral $K L M N$ side $\overline{M N}$ is perpendicular to diagonal $\overline{K M}$, side $\overline{K L}$ is perpendicular to diagonal $\overline{L N}, M N=65$, and $K L=28$. The line through $L$ perpendicular to side $\overline{K N}$ intersects diagonal $\overline{K M}$ at $O$ with $K O=8$. Find $M O$.

## Answer:

There are positive integers $x$ and $y$ that satisfy the system of equations

$$
\begin{aligned}
\log _{10} x+2 \log _{10}(\operatorname{gcd}(x, y)) & =60 \\
\log _{10} y+2 \log _{10}(\operatorname{lcm}(x, y)) & =570
\end{aligned}
$$

Let $m$ be the number of (not necessarily distinct) prime factors in the prime factorization of $x$, and let $n$ be the number of (not necessarily distinct) prime factors in the prime factorization of $y$. Find $3 m+2 n$.

## Answer:

Let $x$ be a real number such that $\sin ^{10} x+\cos ^{10} x=\frac{11}{36}$. Then $\sin ^{12} x+\cos ^{12} x=\frac{m}{n}$ where $m$ and $n$ are relatively prime positive integers. Find $m+n$.

## Answer:

Let $\tau(n)$ denote the number of positive integer divisors of $n$. Find the sum of the six least positive integers $n$ that are solutions to $\tau(n)+\tau(n+1)=7$.

## Answer:

$\square$

## Question 10

Points out of 1

For distinct complex numbers $z_{1}, z_{2}, \ldots, z_{673}$, the polynomial

$$
\left(x-z_{1}\right)^{3}\left(x-z_{2}\right)^{3} \cdots\left(x-z_{673}\right)^{3}
$$

can be expressed as $x^{2019}+20 x^{2018}+19 x^{2017}+g(x)$, where $g(x)$ is a polynomial with complex coefficients and with degree at most 2016. The value of

$$
\left|\sum_{1 \leq j<k \leq 673} z_{j} z_{k}\right|
$$

can be expressed in the form $\frac{m}{n}$, where $m$ and $n$ are relatively prime positive integers. Find $m+n$.

## Answer:

In $\triangle A B C$, the sides have integer lengths and $A B=A C$. Circle $\omega$ has its center at the incenter of $\triangle A B C$. An excircle of $\triangle A B C$ is a circle in the exterior of $\triangle A B C$ that is tangent to one side of the triangle and tangent to the extensions of the other two sides. Suppose that the excircle tangent to $\overline{B C}$ is internally tangent to $\omega$, and the other two excircles are both externally tangent to $\omega$. Find the minimum possible value of the perimeter of $\triangle A B C$.

## Answer:

Given $f(z)=z^{2}-19 z$, there are complex numbers $z$ with the property that $z, f(z)$, and $f(f(z))$ are the vertices of a right triangle in the complex plane with a right angle at $f(z)$. There are positive integers $m$ and $n$ such that one such value of $z$ is $m+\sqrt{n}+11 i$.
Find $m+n$.

## Answer:

Triangle $A B C$ has side lengths $A B=4, B C=5$, and $C A=6$. Points $D$ and $E$ are on ray $A B$ with $A B<A D<A E$. The point $F \neq C$ is a point of intersection of the circumcircles of $\triangle A C D$ and $\triangle E B C$ satisfying $D F=2$ and $E F=7$. Then $B E$ can be expressed as $\frac{a+b \sqrt{c}}{d}$, where $a, b, c$, and $d$ are positive integers such that $a$ and $d$ are relatively prime, and $c$ is not divisible by the square of any prime. Find $a+b+c+d$.

Find the least odd prime factor of $2019^{8}+1$.

Answer: $\square$

Let $\overline{A B}$ be a chord of a circle $\omega$, and let $P$ be a point on the chord $\overline{A B}$. Circle $\omega_{1}$ passes through $A$ and $P$ and is internally tangent to $\omega$. Circle $\omega_{2}$ passes through $B$ and $P$ and is internally tangent to $\omega$. Circles $\omega_{1}$ and $\omega_{2}$ intersect at points $P$ and $Q$. Line $P Q$ intersects $\omega$ at $X$ and $Y$. Assume that $A P=5, P B=3, X Y=11$, and $P Q^{2}=\frac{m}{n}$, where $m$ and $n$ are relatively prime positive integers. Find $m+n$.

Answer:
